In cell biology, mitosis (/ m a? ? t o? s ? s /) is a part of the cell cycle when replicated chromosomes are separated into two new nuclei. Cell division gives rise to genetically identical cells in which the number of chromosomes is maintained. In general, mitosis (division of the nucleus) is preceded by the S stage of interphase (during which the DNA is replicated) and is often ...

The cell cycle, or cell-division cycle, is the series of events that take place in a cell leading to duplication of its DNA (DNA replication) and division of cytoplasm and organelles to produce two daughter cells. In bacteria, which lack a cell nucleus, the cell cycle is divided into the B, C, and D periods. The B period extends from the end of cell division to the beginning of DNA replication.

Introducción. La mitosis es el tipo de división del núcleo celular en la que se conserva intacta la información genética contenida en los cromosomas, que pasa de esta manera sin modificaciones a las dos células hijas resultantes. La mitosis es igualmente un verdadero proceso de multiplicación celular que participa en el desarrollo, el crecimiento y la regeneración del organismo.
