velocity and acceleration calculation pdf

Chapter 10 Velocity, Acceleration, and Calculus The first derivative of position is velocity, and the second derivative is acceleration. These deriv-

Chapter 10 Velocity, Acceleration, and Calculus

In physics, acceleration is the rate of change of velocity of an object with respect to time. An object's acceleration is the net result of all forces acting on the object, as described by Newton's Second Law. The SI unit for acceleration is metre per second squared (m/s^2). Accelerations are vector quantities (they have magnitude and direction) and add according to the parallelogram law.

In physics (specifically, celestial mechanics), escape velocity is the minimum speed needed for a free object to escape from the gravitational influence of a massive body. It is slower the further away from the body an object is, and slower for less massive bodies. The escape velocity from Earth is about 11.186 km/s (6.951 mi/s; 40,270 km/h; 36,700 ft/s; 25,020 mph; 21,744 kn) at the surface.

? vo is what you will use for missions like the Space Shuttle, where you just climb into orbit, deliver or pick up something, then land from orbit. However, if the mission involved travelling to other planets, you will have to use ? esc instead. This is "escape velocity", and is also the delta V required to land from deep space instead of landing from orbit.
