VENTRICULAR ASSIST DEVICES - MEDICAL CLINICAL POLICY

### **ventricular assist devices in pdf**

A ventricular assist device (VAD) is an electromechanical device for assisting cardiac circulation, which is used either to partially or to completely replace the function of a failing heart. The function of VADs is different from that of artificial cardiac pacemakers; some are for short-term use, typically for patients recovering from myocardial infarction (heart attack) and for patients ...

Number: 0654. Policy. Aetna considers a Food and Drug Administration (FDA)-approved ventricular assist device (VAD) medically necessary for any of the following FDA-approved indications: As a bridge to transplant for members who are awaiting heart transplantation (see CPB 0586 - Heart Transplantation) and the device has received FDA approval for a bridge to transplant indication (e.g ...

Remember that LVADs support only the LV and not the RV (BiVADS are used only in acute situations mostly post-operative situations). RV output is mandatory for the LV to fill and if a patient is in VT or VF, there is not RV output and so LV does not fill and pump cannot function.

x In the present issue of the International Journal of Cardiology Mavrogeni et al. [1] addressed the relevant topic of arrhythmias in patients affected by various rheumatic disorders. As Clinicians know, the abrupt onset of arrhythmias might severely complicate the clinical picture of these patients despite a persistent normal regional and global left ventricular function.

An integrated circuit or monolithic integrated circuit (also referred to as an IC, a chip, or a microchip) is a set of electronic circuits on one small flat piece (or "chip") of semiconductor material that is normally silicon. The integration of large numbers of tiny transistors into a small chip results in circuits that are orders of magnitude smaller, cheaper, and faster than those ...
